# POWER POMPEIU'S TYPE INEQUALITIES FOR ABSOLUTELY CONTINUOUS FUNCTIONS WITH APPLICATIONS TO OSTROWSKI'S INEQUALITY 

S. S. DRAGOMIR ${ }^{1,2}$

#### Abstract

In this paper, some power generalizations of Pompeiu's inequality for complex-valued absolutely continuous functions are provided. They are applied to obtain some new Ostrowski type results.

## 1. Introduction

In 1946, Pompeiu [6] derived a variant of Lagrange's mean value theorem, now known as Pompeiu's mean value theorem (see also [8, p. 83]).

Theorem 1 (Pompeiu, 1946 [6]). For every real valued function $f$ differentiable on an interval $[a, b]$ not containing 0 and for all pairs $x_{1} \neq x_{2}$ in $[a, b]$, there exists a point $\xi$ between $x_{1}$ and $x_{2}$ such that

$$
\begin{equation*}
\frac{x_{1} f\left(x_{2}\right)-x_{2} f\left(x_{1}\right)}{x_{1}-x_{2}}=f(\xi)-\xi f^{\prime}(\xi) . \tag{1.1}
\end{equation*}
$$

In 1938, A. Ostrowski [4] proved the following result in the estimating the integral mean:

Theorem 2 (Ostrowski, $1938[4])$. Let $f:[a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$ with $\left|f^{\prime}(t)\right| \leq M<\infty$ for all $t \in(a, b)$. Then for any $x \in[a, b]$, we have the inequality

$$
\begin{equation*}
\left|f(x)-\frac{1}{b-a} \int_{a}^{b} f(t) d t\right| \leq\left[\frac{1}{4}+\left(\frac{x-\frac{a+b}{2}}{b-a}\right)^{2}\right] M(b-a) \tag{1.2}
\end{equation*}
$$

The constant $\frac{1}{4}$ is best possible in the sense that it cannot be replaced by a smaller quantity.

In order to provide another approximation of the integral mean, by making use of the Pompeiu's mean value theorem, the author proved the following result:

Theorem 3 (Dragomir, $2005[3]$ ). Let $f:[a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$ with $[a, b]$ not containing 0 . Then for any $x \in[a, b]$, we have

[^0]the inequality
\[

$$
\begin{align*}
& \left|\frac{a+b}{2} \cdot \frac{f(x)}{x}-\frac{1}{b-a} \int_{a}^{b} f(t) d t\right|  \tag{1.3}\\
& \leq \frac{b-a}{|x|}\left[\frac{1}{4}+\left(\frac{x-\frac{a+b}{2}}{b-a}\right)^{2}\right]\left\|f-\ell f^{\prime}\right\|_{\infty}
\end{align*}
$$
\]

where $\ell(t)=t, t \in[a, b]$.
The constant $\frac{1}{4}$ is sharp in the sense that it cannot be replaced by a smaller constant.

In [7], E. C. Popa using a mean value theorem obtained a generalization of (1.3) as follows:

Theorem 4 (Popa, 2007 [7]). Let $f:[a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$. Assume that $\alpha \notin[a, b]$. Then for any $x \in[a, b]$, we have the inequality

$$
\begin{align*}
& \left|\left(\frac{a+b}{2}-\alpha\right) f(x)+\frac{\alpha-x}{b-a} \int_{a}^{b} f(t) d t\right|  \tag{1.4}\\
& \leq\left[\frac{1}{4}+\left(\frac{x-\frac{a+b}{2}}{b-a}\right)^{2}\right](b-a)\left\|f-\ell_{\alpha} f^{\prime}\right\|_{\infty}
\end{align*}
$$

where $\ell_{\alpha}(t)=t-\alpha, t \in[a, b]$.
In [5], J. Pečarić and S. Ungar have proved a general estimate with the p-norm, $1 \leq p \leq \infty$ which for $p=\infty$ give Dragomir's result.

Theorem 5 (Pečarić \& Ungar, $2006[5])$. Let $f:[a, b] \rightarrow \mathbb{R}$ be continuous on $[a, b]$ and differentiable on $(a, b)$ with $0<a<b$. Then for $1 \leq p, q \leq \infty$ with $\frac{1}{p}+\frac{1}{q}=1$ we have the inequality

$$
\begin{equation*}
\left|\frac{a+b}{2} \cdot \frac{f(x)}{x}-\frac{1}{b-a} \int_{a}^{b} f(t) d t\right| \leq P U(x, p)\left\|f-\ell f^{\prime}\right\|_{p} \tag{1.5}
\end{equation*}
$$

for $x \in[a, b]$, where

$$
\begin{aligned}
P U(x, p): & =(b-a)^{\frac{1}{p}-1}\left[\left(\frac{a^{2-q}-x^{2-q}}{(1-2 q)(2-q)}+\frac{x^{2-q}-a^{1+q} x^{1-2 q}}{(1-2 q)(1+q)}\right)^{1 / q}\right. \\
& \left.+\left(\frac{b^{2-q}-x^{2-q}}{(1-2 q)(2-q)}+\frac{x^{2-q}-b^{1+q} x^{1-2 q}}{(1-2 q)(1+q)}\right)^{1 / q}\right]
\end{aligned}
$$

In the cases $(p, q)=(1, \infty),(\infty, 1)$ and $(2,2)$ the quantity $P U(x, p)$ has to be taken as the limit as $p \rightarrow 1, \infty$ and 2 , respectively.

For other inequalities in terms of the $p$-norm of the quantity $f-\ell_{\alpha} f^{\prime}$, where $\ell_{\alpha}(t)=t-\alpha, t \in[a, b]$ and $\alpha \notin[a, b]$ see [1] and [2].

In this paper, some power Pompeiu's type inequalities for complex valued absolutely continuous functions are provided. They are applied to obtain some new Ostrowski type inequalities.

## 2. Power Pompeiu's Type Inequalities

The following inequality is useful to derive some Ostrowski type inequalities.
Corollary 1 (Pompeiu's Inequality). With the assumptions of Theorem 1 and if $\left\|f-\ell f^{\prime}\right\|_{\infty}=\sup _{t \in(a, b)}\left|f(t)-t f^{\prime}(t)\right|<\infty$ where $\ell(t)=t, t \in[a, b]$, then

$$
\begin{equation*}
|t f(x)-x f(t)| \leq\left\|f-\ell f^{\prime}\right\|_{\infty}|x-t| \tag{2.1}
\end{equation*}
$$

for any $t, x \in[a, b]$.
The inequality (2.1) was stated by the author in [3].
We can generalize the above inequality for the power function as follows.
Lemma 1. Let $f:[a, b] \rightarrow \mathbb{C}$ be an absolutely continuous function on the interval $[a, b]$ with $b>a>0$. If $r \in \mathbb{R}, r \neq 0$, then for any $t, x \in[a, b]$ we have

$$
\begin{align*}
& \left|t^{r} f(x)-x^{r} f(t)\right|  \tag{2.2}\\
& \leq\left\{\begin{array}{l}
\frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty}\left|t^{r}-x^{r}\right|, \text { if } f^{\prime} \ell-r f \in L_{\infty}[a, b], \\
\left\|f^{\prime} \ell-r f\right\|_{p} \\
\quad \times\left\{\begin{array}{l}
\frac{t^{r} x^{r}}{|1-q(r+1)|^{1 / q}}\left|\frac{1}{x^{1-q(r+1)}}-\frac{1}{t^{1-q(r+1)}}\right|^{1 / q}, \text { for } r \neq-\frac{1}{p} \\
t^{r} x^{r}|\ln x-\ln t|^{1 / q}
\end{array}, \text { for } r=-\frac{1}{p}\right. \\
i f f^{\prime} \ell-r f \in L_{p}[a, b], \\
\left\|f^{\prime} \ell-r f\right\|_{1} \frac{t^{r} x^{r}}{\min \left\{x^{r+1}, t^{r+1}\right\}}
\end{array}\right.
\end{align*}
$$

or, equivalently

$$
\begin{align*}
& \left|\frac{f(x)}{x^{r}}-\frac{f(t)}{t^{r}}\right|  \tag{2.3}\\
& \leq\left\{\begin{array}{l}
\frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right|, \text { if } f^{\prime} \ell-r f \in L_{\infty}[a, b], \\
\left\|f^{\prime} \ell-r f\right\|_{p} \\
\quad \times\left\{\begin{array}{l}
\frac{1}{|1-q(r+1)|^{1 / q}}\left|\frac{1}{x^{1-q(r+1)}}-\frac{1}{t^{1-q(r+1)}}\right|^{1 / q}, \text { for } r \neq-\frac{1}{p} \\
|\ln x-\ln t|^{1 / q}, \text { for } r=-\frac{1}{p} \\
i f f^{\prime} \ell-r f \in L_{p}[a, b], \\
\left\|f^{\prime} \ell-r f\right\|_{1} \frac{1}{\min \left\{x^{r+1}, t^{r+1}\right\}},
\end{array}\right.
\end{array} . \begin{array}{l}
\|
\end{array}\right.
\end{align*}
$$

where $p>1, \frac{1}{p}+\frac{1}{q}=1$.
Proof. If $f$ is absolutely continuous, then $f /(\cdot)^{r}$ is absolutely continuous on the interval $[a, b]$ and

$$
\int_{t}^{x}\left(\frac{f(s)}{s^{r}}\right)^{\prime} d s=\frac{f(x)}{x^{r}}-\frac{f(t)}{t^{r}}
$$

for any $t, x \in[a, b]$ with $x \neq t$.
Since

$$
\int_{t}^{x}\left(\frac{f(s)}{s^{r}}\right)^{\prime} d s=\int_{t}^{x} \frac{f^{\prime}(s) s^{r}-r s^{r-1} f(s)}{s^{2 r}} d s=\int_{t}^{x} \frac{f^{\prime}(s) s-r f(s)}{s^{r+1}} d s
$$

then we get the following identity

$$
\begin{equation*}
t^{r} f(x)-x^{r} f(t)=x^{r} t^{r} \int_{t}^{x} \frac{f^{\prime}(s) s-r f(s)}{s^{r+1}} d s \tag{2.4}
\end{equation*}
$$

for any $t, x \in[a, b]$.
Taking the modulus in (2.4) we have

$$
\begin{align*}
\left|t^{r} f(x)-x^{r} f(t)\right| & =x^{r} t^{r}\left|\int_{t}^{x} \frac{f^{\prime}(s) s-r f(s)}{s^{r+1}} d s\right|  \tag{2.5}\\
& \leq x^{r} t^{r}\left|\int_{t}^{x} \frac{\left|f^{\prime}(s) s-r f(s)\right|}{s^{r+1}} d s\right|:=I
\end{align*}
$$

and utilizing Hölder's integral inequality we deduce

$$
\begin{align*}
I \leq & x^{r} t^{r} \times\left\{\begin{array}{l}
\sup _{s \in[t, x]([x, t])}\left|f^{\prime}(s) s-r f(s)\right|\left|\int_{t}^{x} \frac{1}{s^{r+1}} d s\right| \\
\left|\int_{t}^{x}\right| f^{\prime}(s) s-\left.\left.r f(s)\right|^{p} d s\right|^{1 / p}\left|\int_{t}^{x} \frac{1}{s^{q(r+1)}} d s\right|^{1 / q}, \\
\left|\int_{t}^{x}\right| f^{\prime}(s) s-r f(s)|d s| \sup _{s \in[t, x]([x, t])}\left\{\frac{1}{s^{r+1}}\right\},
\end{array}\right.  \tag{2.6}\\
= & x^{r} t^{r} \times\left\{\begin{array}{l}
\frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right|, \\
\left\|f^{\prime} \ell-r f\right\|_{p} \\
\quad \times\left\{\begin{array}{l}
\frac{1}{|1-q(r+1)|^{1 / q}}\left|\frac{1}{x^{1-q(r+1)}}-\frac{1}{t^{1-q(r+1)}}\right|^{1 / q}, \\
|\ln x-\ln t|^{1 / q}, r=-\frac{1}{p}
\end{array}\right. \\
\left\|f^{\prime} \ell-r f\right\|_{1} \frac{1}{\min \left\{x^{r+1}, t^{r+1}\right\}},
\end{array}\right.
\end{align*}
$$

where $p>1, \frac{1}{p}+\frac{1}{q}=1$, and the inequality (2.2) is proved.

## 3. Some Ostrowski Type Results

The following new result also holds.
Theorem 6. Let $f:[a, b] \rightarrow \mathbb{C}$ be an absolutely continuous function on the interval $[a, b]$ with $b>a>0$. If $r \in \mathbb{R}, r \neq 0$, and $f^{\prime} \ell-r f \in L_{\infty}[a, b]$, then for any $x \in[a, b]$ we have

$$
\begin{align*}
& \left|\frac{b^{r+1}-a^{r+1}}{r+1} f(x)-x^{r} \int_{a}^{b} f(t) d t\right|  \tag{3.1}\\
& \leq \frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty} \\
& \times \begin{cases}\frac{2 r x^{r+1}-x^{r}(a+b)(r+1)+b^{r+1}+a^{r+1}}{r+1}, & \text { if } r>0 \\
\frac{x^{r}(a+b)(r+1)-2 r x^{r+1}-b^{r+1}-a^{r+1}}{r+1}, & \text { if } r \in(-\infty, 0) \backslash\{-1\} .\end{cases}
\end{align*}
$$

Also, for $r=-1$, we have

$$
\begin{equation*}
\left|f(x) \ln \frac{b}{a}-\frac{1}{x} \int_{a}^{b} f(t) d t\right| \leq 2\left\|f^{\prime} \ell+f\right\|_{\infty}\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right) \tag{3.2}
\end{equation*}
$$

for any $x \in[a, b]$, provided $f^{\prime} \ell+f \in L_{\infty}[a, b]$.
The constant 2 in (3.2) is best possible.
Proof. Utilising the first inequality in (2.2) for $r \neq-1$ we have

$$
\begin{align*}
\left|\frac{b^{r+1}-a^{r+1}}{r+1} f(x)-x^{r} \int_{a}^{b} f(t) d t\right| & \leq \int_{a}^{b}\left|t^{r} f(x)-x^{r} f(t)\right| d t  \tag{3.3}\\
& \leq \frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty} \int_{a}^{b}\left|t^{r}-x^{r}\right| d t
\end{align*}
$$

Observe that

$$
\begin{aligned}
& \int_{a}^{b}\left|t^{r}-x^{r}\right| d t \\
& =\left\{\begin{array}{l}
\int_{a}^{x}\left(x^{r}-t^{r}\right) d t+\int_{x}^{b}\left(t^{r}-x^{r}\right) d t, \text { if } r>0 \\
\int_{a}^{x}\left(t^{r}-x^{r}\right) d t+\int_{x}^{b}\left(x^{r}-t^{r}\right) d t, \text { if } r \in(-\infty, 0) \backslash\{-1\}
\end{array}\right.
\end{aligned}
$$

Then for $r>0$ we have

$$
\begin{aligned}
& \int_{a}^{x}\left(x^{r}-t^{r}\right) d t+\int_{x}^{b}\left(t^{r}-x^{r}\right) d t \\
& =x^{r}(x-a)-\frac{x^{r+1}-a^{r+1}}{r+1}+\frac{b^{r+1}-x^{r+1}}{r+1}-x^{r}(b-x) \\
& =2 x^{r+1}-x^{r}(a+b)+\frac{b^{r+1}+a^{r+1}-2 x^{r+1}}{r+1} \\
& =\frac{2 r x^{r+1}+2 x^{r+1}-x^{r}(a+b)(r+1)+b^{r+1}+a^{r+1}-2 x^{r+1}}{r+1} \\
& =\frac{2 r x^{r+1}-x^{r}(a+b)(r+1)+b^{r+1}+a^{r+1}}{r+1}
\end{aligned}
$$

and for $r \in(-\infty, 0) \backslash\{-1\}$ we have

$$
\begin{aligned}
& \int_{a}^{x}\left(t^{r}-x^{r}\right) d t+\int_{x}^{b}\left(x^{r}-t^{r}\right) d t \\
& =-\frac{2 r x^{r+1}-x^{r}(a+b)(r+1)+b^{r+1}+a^{r+1}}{r+1}
\end{aligned}
$$

Making use of (3.3) we get (3.1).
Utilizing the inequality (2.2) for $r=-1$ we have

$$
\left|t^{-1} f(x)-x^{-1} f(t)\right| \leq\left\|f^{\prime} \ell+f\right\|_{\infty}\left|t^{-1}-x^{-1}\right|
$$

if $f^{\prime} \ell+f \in L_{\infty}[a, b]$.
Integrating this inequality, we have

$$
\begin{align*}
\left|f(x) \ln \frac{b}{a}-x^{-1} \int_{a}^{b} f(t) d t\right| & \leq \int_{a}^{b}\left|t^{-1} f(x)-x^{-1} f(t)\right| d t  \tag{3.4}\\
& \leq\left\|f^{\prime} \ell+f\right\|_{\infty} \int_{a}^{b}\left|t^{-1}-x^{-1}\right| d t
\end{align*}
$$

Since

$$
\begin{aligned}
\int_{a}^{b}\left|\frac{1}{x}-\frac{1}{t}\right| d t & =\left[\int_{a}^{x}\left(\frac{1}{t}-\frac{1}{x}\right) d t+\int_{x}^{b}\left(\frac{1}{x}-\frac{1}{t}\right) d t\right] \\
& =\left(\ln \frac{x}{a}-\frac{x-a}{x}+\frac{b-x}{x}-\ln \frac{b}{x}\right) \\
& =\ln \frac{x^{2}}{a b}+\frac{a+b-2 x}{x} \\
& =2\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right)
\end{aligned}
$$

then by (3.4) we get the desired inequality (3.2).
Now, assume that (3.2) holds with a constant $C>0$, i.e.

$$
\begin{equation*}
\left|f(x) \ln \frac{b}{a}-x^{-1} \int_{a}^{b} f(t) d t\right| \leq C\left\|f^{\prime} \ell+f\right\|_{\infty}\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right) \tag{3.5}
\end{equation*}
$$

for any $x \in[a, b]$.
If we take in (3.5) $f(t)=1, t \in[a, b]$, then we get

$$
\begin{equation*}
\left|\ln \frac{b}{a}-\frac{b-a}{x}\right| \leq C\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right) \tag{3.6}
\end{equation*}
$$

for any for any $x \in[a, b]$.
Making $x=a$ in (3.5) produces the inequality

$$
\left|\ln \frac{b}{a}-\frac{b-a}{a}\right| \leq C\left(\frac{b-a}{2 a}-\frac{1}{2} \ln \frac{b}{a}\right)
$$

which implies that $C \geq 2$.
This proves the sharpness of the constant 2 in (3.2).
Remark 1. Consider the $r$-Logarithmic mean

$$
L_{r}=L_{r}(a, b):=\left[\frac{b^{r+1}-a^{r+1}}{(r+1)(b-a)}\right]^{1 / r}
$$

defined for $r \in \mathbb{R} \backslash\{0,-1\}$ and the Logarithmic mean, defined as

$$
L=L(a, b):=\frac{b-a}{\ln b-\ln a} .
$$

If $A=A(a, b):=\frac{a+b}{2}$, then from (3.1) we get for $x=A$ the inequality

$$
\begin{align*}
& \left|L_{r}^{r}(b-a) f(A)-A^{r} \int_{a}^{b} f(t) d t\right|  \tag{3.7}\\
& \leq \frac{2}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty} \begin{cases}\frac{A\left(b^{r+1}, a^{r+1}\right)-A^{r+1}}{r+1}, & \text { if } r>0 \\
\frac{A^{r+1}-A\left(b^{r+1}, a^{r+1}\right)}{r+1}, & \text { if } r \in(-\infty, 0) \backslash\{-1\},\end{cases}
\end{align*}
$$

while from (3.2) we get

$$
\begin{equation*}
\left|L^{-1}(b-a) f(A)-A^{-1} \int_{a}^{b} f(t) d t\right| \leq 2\left\|f^{\prime} \ell+f\right\|_{\infty} \ln \frac{A}{G} \tag{3.8}
\end{equation*}
$$

The following related result holds.
Theorem 7. Let $f:[a, b] \rightarrow \mathbb{C}$ be an absolutely continuous function on the interval $[a, b]$ with $b>a>0$. If $r \in \mathbb{R}, r \neq 0$, then for any $x \in[a, b]$ we have

$$
\begin{align*}
& \left|\frac{f(x)}{x^{r}}(b-a)-\int_{a}^{b} \frac{f(t)}{t^{r}} d t\right|  \tag{3.9}\\
& \leq \frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty} \\
& \times\left\{\begin{array}{l}
\frac{2 x^{1-r}-a^{1-r}-b^{1-r}}{1-r}+\frac{1}{x^{r}}(b+a-2 x), \quad r \in(0, \infty) \backslash\{1\} \\
\frac{a^{1-r}+b^{1-r}-2 x^{1-r}}{1-r}+\frac{1}{x^{r}}(2 x-a-b), \text { if } r<0 .
\end{array}\right.
\end{align*}
$$

Also, for $r=1$, we have

$$
\begin{equation*}
\left|\frac{f(x)}{x}(b-a)-\int_{a}^{b} \frac{f(t)}{t} d t\right| \leq 2\left\|f^{\prime} \ell-f\right\|_{\infty}\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right) \tag{3.10}
\end{equation*}
$$

for any $x \in[a, b]$, provided $f^{\prime} \ell-f \in L_{\infty}[a, b]$.
The constant 2 is best possible in (3.10).
Proof. From the first inequality in (2.3) we have

$$
\begin{equation*}
\left|\frac{f(x)}{x^{r}}-\frac{f(t)}{t^{r}}\right| \leq \frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right| \tag{3.11}
\end{equation*}
$$

for any $t, x \in[a, b]$, provided $f^{\prime} \ell-r f \in L_{\infty}[a, b]$.
Integrating over $t \in[a, b]$ we get

$$
\begin{align*}
\left|\frac{f(x)}{x^{r}}(b-a)-\int_{a}^{b} \frac{f(t)}{t^{r}} d t\right| & \leq \int_{a}^{b}\left|\frac{f(x)}{x^{r}}-\frac{f(t)}{t^{r}}\right| d t  \tag{3.12}\\
& \leq \frac{1}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty} \int_{a}^{b}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right| d t
\end{align*}
$$

for $r \in \mathbb{R}, r \neq 0$.
For $r \in(0, \infty) \backslash\{1\}$ we have

$$
\begin{aligned}
& \int_{a}^{b}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right| d t \\
& =\int_{a}^{x}\left(\frac{1}{t^{r}}-\frac{1}{x^{r}}\right) d t+\int_{x}^{b}\left(\frac{1}{x^{r}}-\frac{1}{t^{r}}\right) d t \\
& =\frac{x^{1-r}-a^{1-r}}{1-r}-\frac{1}{x^{r}}(x-a)+\frac{1}{x^{r}}(b-x)-\frac{b^{1-r}-x^{1-r}}{1-r} \\
& =\frac{2 x^{1-r}-a^{1-r}-b^{1-r}}{1-r}+\frac{1}{x^{r}}(b+a-2 x)
\end{aligned}
$$

for any $x \in[a, b]$.
For $r<0$, we also have

$$
\int_{a}^{b}\left|\frac{1}{x^{r}}-\frac{1}{t^{r}}\right| d t=\frac{a^{1-r}+b^{1-r}-2 x^{1-r}}{1-r}+\frac{1}{x^{r}}(2 x-a-b)
$$

for any $x \in[a, b]$.

For $r=1$ we have

$$
\int_{a}^{b}\left|\frac{1}{x}-\frac{1}{t}\right| d t=2\left(\ln \frac{x}{\sqrt{a b}}+\frac{\frac{a+b}{2}-x}{x}\right)
$$

for any $x \in[a, b]$, and the inequality (3.10) is obtained.
The sharpness of the constant 2 follows as in the proof of Theorem 6 and the details are omitted.

Remark 2. If we take $x=A$ in Theorem 7, then we we have

$$
\begin{align*}
& \left|\frac{f(A)}{A^{r}}(b-a)-\int_{a}^{b} \frac{f(t)}{t^{r}} d t\right|  \tag{3.13}\\
& \leq \frac{2}{|r|}\left\|f^{\prime} \ell-r f\right\|_{\infty}\left\{\begin{array}{l}
\frac{A^{1-r}-A\left(a^{1-r}, b^{1-r}\right)}{1-r}, r \in(0, \infty) \backslash\{1\}, \\
\frac{A\left(a^{1-r}, b^{1-r}\right)-A^{1-r}}{1-r},
\end{array} \text { if } r<0\right.
\end{align*}
$$

Also, for $r=1$, we have

$$
\begin{equation*}
\left|\frac{f(A)}{A}(b-a)-\int_{a}^{b} \frac{f(t)}{t} d t\right| \leq 2\left\|f^{\prime} \ell-f\right\|_{\infty} \ln \frac{A}{G} \tag{3.14}
\end{equation*}
$$

Remark 3. The interested reader may obtain other similar results in terms of the $p$-norms $\left\|f^{\prime} \ell-r f\right\|_{p}$ with $p \geq 1$. However, since some calculations are too complicated, the details are not presented here.
