# Selfie Fractions: Addable

Inder J. Taneja<sup>1</sup>

## Abstract

A **addable fraction** is a proper fraction where addition signs can be inserted into numerator and denominator, and the resulting fraction is equal to the original. This work brings addable fractions in different situations. One for multiple choices, and second for single representations. In each fraction, the numerator less than denominator, and there is no repetition of digits.

## 1 Introduction

Kieth [3, 4] for the first gave an idea of *dottable fraction*. It is a proper fraction where multiplication signs can be inserted into numerator and denominator, and the resulting fraction is equal to the original. Keith [3, 4] idea was only with multiplication. For the first time, we extended it to other operations also, such as with *addition, multiplication, potentiation*, etc. We can think all of them together also. See below some examples in each case:

### • Addable Fractions

$$\frac{96}{352} = \frac{9+6}{3+52}, \quad \frac{182}{6734} = \frac{18+2}{6+734}, \quad \text{etc.} \quad (1)$$

### • Subtractable Fractions

$$\frac{204}{357} = \frac{20-4}{35-7}, \quad \frac{726}{1089} = \frac{72-6}{108-9}, \quad \text{etc.} \quad (2)$$

### • Dottable Fraction

$$\frac{13}{624} = \frac{1 \times 3}{6 \times 24}, \quad \frac{416}{728} = \frac{4 \times 16}{7 \times 2 \times 8}, \quad \text{etc.} \quad (3)$$

### • Dottable with Potentiation Fractions

$$\frac{95}{342} = \frac{9 \times 5}{3^4 \times 2}, \quad \frac{728}{1456} = \frac{7^2 \times 8}{14 \times 56}, \quad \text{etc.} \quad (4)$$

### • Mixed Fractions: All Operations

$$\frac{4980}{5312} = \frac{4-9+80}{5 \times (3+1)^2}, \quad \frac{3249}{5168} = \frac{(3+2^4) \times 9}{(5-1) \times 68}, \quad \text{etc.} \quad (5)$$

Observing above examples given in (1)–(5), the numerator and denominator follows the same order of digits in both sides of each fraction. These kind of fractions, we call **Selfie fractions**. There are two types of situations. One when all digits appearing in each fraction are distinct and second, when there are repetitions of digits. Initially, we shall work with distinct digits. The study on repetition of digits shall be dealt elsewhere. This whole work is divided in different parts:

1. Selfie Fractions: Addable – Equation (1) – this work ;
2. Selfie Fractions: Dottable and Pontentiable – [28];
3. Selfie Fractions: Addable and Dottable Together – [29];
4. Equivalent Selfie Fractions: Dottable, Addable and Subtractable – [30];
5. Equivalent Selfie Fractions: Addable and Dottable Together– [31].

In this paper, we shall bring examples of *addable fractions* similar to equation (1). For simplicity, it is considered numerator less than denominator. The study is limited up to six digits in the denominator. This work brings *addable fractions* in two different ways. One for multiple choices, and second for single representations. Each fraction is without repetition of digits.

The study on numbers in different situations, refer author's work [7]-[27]. For other studies see also [1, 2, 5, 6].

The work is divided in two sections as below:

2 Addable Fractions: Multiple Representations;

3 Addable Fractions: Single Representation.

## 2 Addable Fractions: Multiple Representations

In this section, we shall present *addable fractions* where there is no repetition of digits, but in each case there are multiple choices, i.e., each *addable fraction* has more than one way of representation. Let us separate by small subsections according to number of digits in each fraction.
