CHARACTERIZATIONS OF CLASSES OF HARMONIC CONVEX FUNCTIONS
AND APPLICATIONS

IMRAN ABBAS BALOCH

Abstract. In this paper, we consider classes of harmonic convex functions and give their special characterizations. Furthermore, we consider Hermite Hadamard type inequalities related to these classes to give some non-numeric estimate of well-known definite integrals.

1. Introduction

The classical or the usual convexity is defined as follows:
A function \( f : \emptyset \neq I \subseteq \mathbb{R} \rightarrow \mathbb{R} \), is said to be convex on \( I \) if inequality
\[
\frac{f(tx + (1-t)y)}{t} \leq tf(x) + (1-t)f(y)
\]
holds for all \( x, y \in I \) and \( t \in [0,1] \).

A number of papers have been written on inequalities using the classical convexity and one of the most fascinating inequalities in mathematical analysis is stated as follows
\[
\frac{f(x + \frac{b-a}{2}y)}{b-a} \leq \int_{a}^{b} f(x)dx \leq \frac{f(a) + f(b)}{2},
\]
where \( f : I \subseteq \mathbb{R} \rightarrow \mathbb{R} \) be a convex mapping and \( a, b \in I \) with \( a \leq b \). Both the inequalities hold in reversed direction if \( f \) is concave. The inequalities stated in (1.1) are known as Hermite-Hadamard inequalities.

For more results on (1.1) which provide new proof, significantly extensions, generalizations, refinements, counterparts, new Hermite-Hadamard-type inequalities and numerous applications, we refer the interested reader [1, 2, 3, 4] and the references therein.

The usual notion of convex function have been generalized in diverse manners. Some of them is the so called harmonically convex function, harmonically \( (\alpha,m) \)-convex function and \( p \)-convex, which are stated in the definitions below.

Definition 1.1. [9] A function \( f : I \subset \mathbb{R} \setminus \{0\} \rightarrow \mathbb{R} \) is said to be harmonically-convex function on \( I \) if
\[
f \left( \frac{xy}{tx + (1-t)y} \right) \leq tf(y) + (1-t)f(x)
\]
holds for all \( x, y \in I \) and \( t \in [0,1] \). If the inequality is reversed, then \( f \) is said to be harmonically concave.

Definition 1.2. [10] A function \( f : I \subset \mathbb{R} \setminus \{0\} \rightarrow \mathbb{R} \) is said to be harmonically \( (\alpha,m) \)-convex function on \( I \) if
\[
f \left( \frac{mxy}{mty + (1-t)x} \right) \leq t^\alpha f(x) + m(1-t^\alpha)f(y)
\]
holds for all \( x, y \in I \) and \( t \in [0,1] \), where \( \alpha \in [0,1] \) and \( m \in (0,1] \). If the inequality is reversed, then \( f \) is said to be harmonically \( (\alpha,m) \)-concave.

Key words and phrases. harmonic convex functions, harmonic \( (p,(s,m)) \)-convex functions, Hermite Hadamard inequalities, well-known definite integrals.

RGMIA Res. Rep. Coll. 22 (2019), Art. 59, 9 pp. Received 13/06/19
Definition 1.3. [12] Let $I \subset \mathbb{R}$ be a real interval. A function $f : I \to \mathbb{R}$ is $p$-convex, where $p \in \mathbb{R}\{0\}$ if

$$f \left( \left[ tx^p + (1-t)y^p \right]^\frac{1}{p} \right) \leq tf(y) + (1-t)f(x)$$

holds for all $x, y \in I$ and $t \in [0, 1]$. If the inequality is reversed, then $f$ is said to be $p$-concave.

2. Main Results

The convexity of functions and their generalized forms, play an important role in many fields such as Economic Science, Biology, Optimization. In recent years, several extensions, refinements, and generalizations have been considered for classical convexity. In [7], I. A. Baloch and İ. İşcan defined a new class of functions which is defined as follow:

Definition 2.1. [7] [6] A function $f : I \subset \mathbb{R}\{0\} \to \mathbb{R}$ is said to be harmonically $(s,m)$-convex function on $I$ if

$$f \left( \frac{mxy}{mty + (1-t)x} \right) \leq tsf(x) + m(1-t)sf(y)$$

holds for all $x, y \in I$ and $t \in [0, 1]$, where $s \in (0, 1]$ and $m \in (0, 1]$. If the inequality is reversed, then $f$ is said to be harmonically $(s,m)$-concave.

Definition 2.2. [5] A function $f : I \subset \mathbb{R}\{0\} \to \mathbb{R}$ is said to be harmonically $(p,(s,m))$-convex function, where $p \in \mathbb{R}\{0\}$, $s, m \in (0, 1]$, if

$$f \left( \frac{mxy}{[t(my)^p + (1-t)x^p]^\frac{1}{p}} \right) \leq tsf(x) + m(1-t)sf(y),$$

for all $x, y \in I$ with $my \in I$ and $t \in [0, 1]$. If the inequality is reversed, then $f$ is said to be harmonically $(p,(s,m))$-concave.

Now, first of all, we give an example of harmonic convex function which is not convex function.

\[ f(x) = \ln(x) \]
Here, some more examples of harmonic convex functions.

\[ f(x) = \sqrt{x} \]

\[ f(x) = \frac{1}{x^2} \]

\[ f(x) = \begin{cases} 
\frac{1-x}{x} & \text{if } 0 < x \leq 1 \\
0 & \text{if } 1 < x \leq 2 \\
\frac{x-2}{x} & \text{if } x > 2 
\end{cases} \]

**Lemma 2.3.** Let \( I \subset \mathbb{R}/\{0\} \) be a real interval such that \( \forall x \in I \Rightarrow \frac{1}{x} \in I \). A function \( f : I \to \mathbb{R} \) is harmonically convex if and only if \( f(\frac{1}{x}) \) is convex.

**Proof.** A function \( f \) is harmonically convex function on \( I \) if and only if

\[ f \left( \frac{xy}{tx + (1-t)y} \right) \leq tf(y) + (1-t)f(x) \]
for all \(x, y \in I\) and \(t \in [0, 1]\). Equivalently, a function \(f\) is harmonically convex function on \(I\) if and only if
\[
 f\left(\frac{1}{y} + \frac{1}{z} \right) \leq tf(y) + (1 - t)f(x)
\]
for all \(x, y \in I\) and \(t \in [0, 1]\). Since, \(x, y \in I\), this implies that \(\frac{1}{x}, \frac{1}{y} \in I\) and therefore, above inequality remains true if we replace \(x\) by \(\frac{1}{x}\) and \(y\) by \(\frac{1}{y}\). This means that a function \(f\) is harmonically convex function on \(I\) if and only if
\[
 f\left(\frac{1}{ty} + (1 - t)x\right) \leq tf\left(\frac{1}{y}\right) + (1 - t)f\left(\frac{1}{x}\right)
\]
for all \(x, y \in I\) and \(t \in [0, 1]\). This show that a function \(f\) is harmonically convex function on \(I\) if and only if \(f\left(\frac{1}{x}\right)\) is convex.

**Lemma 2.4.** [11] Let \(f\) be a real function defined on an interval \(I \subset \mathbb{R}\). Then, \(f\) is convex if and only if
\[
\begin{vmatrix}
 1 & x & f(x) \\
 1 & y & f(y) \\
 1 & z & f(z)
\end{vmatrix}
\begin{vmatrix}
 1 & x^2 \\
 1 & y^2 \\
 1 & z^2
\end{vmatrix} \geq 0
\]
for all three distinct points \(x, y, z\) of \(I\); equivalently, if and only if
\[
\begin{vmatrix}
 1 & x & f(x) \\
 1 & y & f(y) \\
 1 & z & f(z)
\end{vmatrix} \geq 0
\]
for all \(x < y < z\) in \(I\).

**Lemma 2.5.** Let \(I \subset \mathbb{R}/\{0\}\) be a real interval such that \(\forall x \in I \Rightarrow \frac{1}{x} \in I\). A function \(f : I \rightarrow \mathbb{R}\) is harmonically convex if and only if \(xf(x)\) is convex.

**Proof.** From the Lemma 2.3, a function \(f\) is harmonically convex function on \(I\) if and only if \(f\left(\frac{1}{x}\right)\) is convex and by 2.4, a function \(f\left(\frac{1}{x}\right)\) is convex if and only if
\[
\begin{vmatrix}
 1 & x_1 & f\left(\frac{1}{x_1}\right) \\
 1 & x_2 & f\left(\frac{1}{x_2}\right) \\
 1 & x_3 & f\left(\frac{1}{x_3}\right)
\end{vmatrix} \geq 0
\]
for all \(x_1, x_2, x_3 \in I\) such that \(x_1 < x_2 < x_3\). Equivalently,
\[
\begin{vmatrix}
 1 & \frac{1}{y_1} & f(y_1) \\
 1 & \frac{1}{y_2} & f(y_2) \\
 1 & \frac{1}{y_3} & f(y_3)
\end{vmatrix} \geq 0
\]
whenever \(y_1 > y_2 > y_3\). Now, by the multiplying the ith row of the determinant by \(y_i\), interchanging the first and third row, first and second column, and relabeling \(y_3 = z_1\), \(y_2 = z_2\) and \(y_1 = z_3\), we arrive at
\[
\begin{vmatrix}
 1 & z_1 & z_1f(z_1) \\
 1 & z_2 & z_2f(z_2) \\
 1 & z_3 & z_3f(z_3)
\end{vmatrix} \geq 0
\]
for all \(z_1, z_2, z_3 \in I\) such that \(z_1 < z_2 < z_3\), which is equivalent to the convexity of the function \(zf(z)\).

**Proposition 2.6.** [9] Let \(I \subset \mathbb{R}/\{0\}\) be a real interval and \(f : I \rightarrow \mathbb{R}\) is a function, then ;
1) If \(I \subset (0, \infty)\) and \(f\) is convex and nondecreasing function, then \(f\) is harmonically convex function.
2) If \(I \subset (0, \infty)\) and \(f\) is harmonically convex and nonincreasing function, then \(f\) is convex function.
3) If \(I \subset (-\infty, 0)\) and \(f\) is harmonically convex and nondecreasing function, then \(f\) is convex function.
4) If \(I \subset (-\infty, 0)\) and \(f\) is convex and nonincreasing function, then \(f\) is harmonically convex function.
Theorem 2. Let \( p \) be harmonically convex and \( f \) be harmonically convex on \( I \). Then the above inequalities are sharp.

Proof. The proof is immediate by following inequality

\[
0 \leq t(1-t)(x-y)^2
\]

for all \( x, y \in I \). Equivalently,

\[
\frac{xy}{tx + (1-t)y} \leq ty + (1-t)x
\]

for all \( x, y \in (0, \infty) \), and

\[
\frac{xy}{tx + (1-t)y} \geq ty + (1-t)x
\]

for all \( x, y \in (-\infty, 0) \). 

Examples:

- Let \( f : (0, \infty) \to \mathbb{R} \), \( f(x) = x \) and \( g : (-\infty, 0) \to \mathbb{R} \), \( g(x) = x \), then \( f \) is a harmonically convex function and \( g \) is a harmonically concave function.
- Let \( f : (0, \infty) \to \mathbb{R} \),

\[
f(x) = \begin{cases} x, & 0 < x < 2 \\ 4 - \frac{4}{x}, & x \geq 2 \end{cases}
\]

is harmonically convex function on \((0, \infty)\), since \( xf(x) \) is convex on \((0, \infty)\).
- Let \( f : (0, \infty) \to \mathbb{R} \),

\[
f(x) = \frac{(x-1)^2 + 1}{x}
\]

is harmonically convex function on \((0, \infty)\), since \( xf(x) \) is convex on \((0, \infty)\).
- By the Proposition 2.6, increasing convex function is harmonically convex. This means that \( e^x \) is harmonically convex.

The following result of the Hermite-Hadamard type holds for class of harmonically convex functions.

Theorem 3. Let \( f : I \subset \mathbb{R}/\{0\} \to \mathbb{R} \) be harmonically convex and \( a, b \in I \) with \( a < b \). If \( f \in L[a, b] \), then following inequalities hold

\[
(2.2) \quad f\left(\frac{2ab}{a+b}\right) \leq \frac{(ab)}{b-a} \int_{a}^{b} f(x) \frac{dx}{x^2} \leq \frac{f(a) + f(b)}{2}.
\]

The above inequalities are sharp.

Now, using Lemma 2.5, we get following interesting result.

Theorem 2. Let \( I \subset \mathbb{R}/\{0\} \) be a real interval such that \( \forall x \in I \Rightarrow \frac{1}{x} \in I \). If function \( f : I \to \mathbb{R} \) is harmonically convex and \( a, b \in I \) with \( a < b \) such that \( f \in L[a, b] \), then following inequalities hold

\[
(2.3) \quad \left(\frac{a+b}{2}\right)f\left(\frac{a+b}{2}\right) \leq \frac{1}{b-a} \int_{a}^{b} xf(x) \frac{dx}{x} \leq \frac{af(a) + bf(b)}{2}.
\]

Proof. Since, \( f(x) \) is harmonically convex on \( I \) such that \( \forall x \in I \Rightarrow \frac{1}{x} \in I \), therefore by Lemma 2.5 \( xf(x) \) is convex on \( I \). Hence, by the use of inequality (1.1), we get required result.

Theorem 3. Let \( I \subset \mathbb{R} \) be a real interval. If function \( f : I \to \mathbb{R} \) is \( p \)-convex, where \( p \in \mathbb{R}/\{0\} \) and \( a, b \in I \) with \( a < b \) such that \( f \in L[a, b] \), then following inequalities hold

\[
(2.4) \quad f\left(\left(\frac{ap + bp}{2}\right)^{\frac{1}{p}}\right) \leq \frac{p}{bp - ap} \int_{a}^{b} f(x) \frac{dx}{x^{1-p}} \leq \frac{f(a) + f(b)}{2}.
\]

Lemma 2.7. Let \( I \subset \mathbb{R}/\{0\} \) be a real interval such that \( \forall x \in I \Rightarrow \frac{1}{x} \in I \). A function \( f : I \to \mathbb{R} \) is harmonically \( p \)-convex if and only if \( f\left(\frac{1}{x}\right) \) is \( p \)-convex.
Lemma 2.8. Let $I \subset \mathbb{R}$ be a real interval. A function $f : I \to \mathbb{R}$ is $p$-convex function if and only if

$$
\begin{vmatrix}
1 & x^p f(x) \\
1 & y^p f(y) \\
1 & z^p f(z)
\end{vmatrix} \geq 0
$$

for all $x, y, z \in I$ such that $x < y < z$.

Lemma 2.9. Let $I \subset \mathbb{R}/\{0\}$ be a real interval such that $\forall x \in I \Rightarrow \frac{1}{x} \in I$. A function $f : I \to \mathbb{R}$ is harmonically $p$-convex if and only if $x^p f(x)$ is convex.

Proof. From the Lemma 2.7, a function $f$ is harmonically $p$-convex function on $I$ if and only if $f(\frac{1}{z})$ is $p$-convex and by Lemma 2.8, a function $f(\frac{1}{z})$ is $p$-convex if and only if

$$
\begin{vmatrix}
1 & x_1^p f(\frac{1}{y_1}) \\
1 & x_2^p f(\frac{1}{y_2}) \\
1 & x_3^p f(\frac{1}{y_3})
\end{vmatrix} \geq 0
$$

for all $x_1, x_2, x_3 \in I$ such that $x_1 < x_2 < x_3$. Equivalently

$$
\begin{vmatrix}
1 & \frac{1}{y_1} f(y_1) \\
1 & \frac{1}{y_2} f(y_2) \\
1 & \frac{1}{y_3} f(y_3)
\end{vmatrix} \geq 0
$$

whenever $y_1 > y_2 > y_1$. Now, by the multiplying the $i$th row of the determinant by $y_i^p$, interchanging the first and third row, first and second column, and relabeling $y_3 = z_1$, $y_2 = z_2$ and $y_1 = z_3$, we arrive at

$$
\begin{vmatrix}
1 & z_1^p f(z_1) \\
1 & z_2^p f(z_2) \\
1 & z_3^p f(z_3)
\end{vmatrix} \geq 0
$$

for all $z_1, z_2, z_3 \in I$ such that $z_1 < z_2 < z_3$, which is equivalent to the convexity of the function $z^p f(z)$.

Proposition 2.10. Let $I \subset \mathbb{R}/\{0\}$ be a real interval, $p \in \mathbb{R}/\{0\}$ and $f : I \to \mathbb{R}$ is a function, then:

- If $p \geq 1$ and harmonically convex and nondecreasing function, then $f$ is harmonically $p$-convex function.
- If $p \geq 1$ and harmonically $p$-convex and nonincreasing function, then $f$ is harmonically convex function.
• If $p \geq 1$ and harmonically $p$-concave and nondecreasing function, then $f$ is harmonically concave function.
• If $p \geq 1$ and harmonically concave and nonincreasing function, then $f$ is harmonically $p$-concave function.
• If $p \leq 1$ and harmonically $p$-convex and nondecreasing function, then $f$ is harmonically convex function.
• If $p \leq 1$ and harmonically convex and nonincreasing function, then $f$ is harmonically $p$-convex function.
• If $p \leq 1$ and harmonically concave and nondecreasing function, then $f$ is harmonically $p$-concave function.
• If $p \leq 1$ and harmonically concave and nonincreasing function, then $f$ is harmonically concave function.

Proof. Since $f(x) = x^p$, $p \in (-\infty, 0] \cup [1, \infty)$, is convex function on $(0, \infty)$ and $f(x) = x^p$, $p \in (0, 1]$, is a concave function on $(0, \infty)$, therefore the proof is obvious from the following power mean inequalities

\[
[t x^p + (1-t) y^p]^\frac{1}{p} \geq t x + (1-t) y, \quad p \geq 1
\]

which is equivalent to

\[
\frac{xy}{[tx^p + (1-t)y^p]^\frac{1}{p}} \leq \frac{xy}{tx + (1-t)y}, \quad p \geq 1
\]

and

\[
[t x^p + (1-t) y^p]^\frac{1}{p} \leq t x + (1-t) y, \quad p \leq 1
\]

which is equivalent to

\[
\frac{xy}{tx + (1-t)y} \leq \frac{xy}{[tx^p + (1-t)y^p]^\frac{1}{p}}, \quad p \geq 1,
\]

for all $x, y \in (0, \infty)$ and $t \in [0, 1]$. \square

Similar to inequality given in Theorem 1, we proved the result for harmonically $p$-convex functions as given below

Theorem 4. [5] Let $I \subset \mathbb{R}/\{0\}$ be a real interval and $f : I \subset (0, \infty) \to \mathbb{R}$ be harmonically $p$-convex, $a, b \in I$ with $a \leq b$. If $f \in L[a, b]$, then following inequalities hold

\[
f\left(\frac{2\sqrt{ab}}{a^p + b^p} \right) \leq \frac{p(ab)^p}{b^p - a^p} \int_a^b \frac{f(x)^p}{x^{p+1}} dx \leq \frac{f(a) + f(b)}{2}.
\]

Also, by using Lemma 2.9 and Theorem 3, we have another interesting result as

Theorem 5. Let $I \subset \mathbb{R}/\{0\}$ be a real interval such that $\forall x \in I \Rightarrow \frac{1}{x} \in I$. If function $f : I \to \mathbb{R}$ is harmonically $p$-convex, where $p \in \mathbb{R}/\{0\}$ and $a, b \in I$ with $a < b$ such that $f \in L[a, b]$, then following inequalities hold

\[
\left(\frac{a^p + b^p}{2}\right) f\left(\frac{a^p + b^p}{2}\right)^\frac{1}{p} \leq \frac{p}{b^p - a^p} \int_a^b \frac{f(x)^p}{x^{1+2p}} dx \leq \frac{a^p f(a) + b^p f(b)}{2}.
\]
3. Applications

- we have relation between Harmonic, Logarithmic and Arithmetic means as follow

\[
\frac{2ab}{a+b} \leq \frac{ab}{b-a} (\ln b - \ln a) \leq \frac{a+b}{2} \quad (HLA \ inequality)
\]

whose proof is a direct consequence of inequality of Theorem 1 for \( f(x) = x, \forall x \in (0, \infty) \). Furthermore, we have following consequence of inequality of Theorem 2 for \( f(x) = x, \forall x \in (0, \infty) \).

\[
\left( \frac{a+b}{2} \right)^2 \leq \frac{1}{3} (a^2 + ab + b^2) \leq \frac{a^2 + b^2}{2}.
\]

Even in more general setting for \( p \in \mathbb{R}/\{0,1\} \), we have

\[
\frac{2^p ab}{[a^p + b^p]^{\frac{p+1}{p}}} \leq \frac{p(ab)^p}{b^p - a^p} \left( \frac{b^{1-p} - a^{1-p}}{1-p} \right) \leq \frac{a+b}{2}
\]

which is direct consequence of inequality of Theorem 4 and we have

\[
\left( \frac{a^p + b^p}{2} \right)^{\frac{p+1}{p}} \leq \frac{p}{b^p - a^p} \left( \frac{b^{2p+1} - a^{2p-1}}{2p+1} \right) \leq \frac{a^{p+1} + b^{p+1}}{2}.
\]

which is direct consequence of inequality of Theorem 5 for \( f(x) = x \), \( \forall x \in (0, \infty) \).

- For \( a, b \in (0, \infty) \) and \( a \neq b \), we have

\[
e^{\frac{2ab}{a+b}} \leq \frac{ab}{b-a} \int_a^b e^x dx \leq \frac{e^a + e^b}{2},
\]

whose proof is a direct consequence of inequality of Theorem 1 and we have

\[
(\frac{a+b}{2}).e^{\frac{a+b}{2}} \leq \frac{(1-a)e^a + (b-1)e^b}{b-a} \leq \frac{ae^a + be^b}{2}.
\]

which is a direct consequence of inequality of Theorem 2 for \( f(x) = e^x \) which is not only harmonic convex function, even it is a harmonic p-convex function too. Therefore, for \( p \geq 1 \), we have

\[
e^{\frac{2ab}{a+b}} \left( e^x \right)^{\frac{2ab}{a+b}} \leq \frac{p(ab)^p}{b^p - a^p} \int_a^b e^x dx \leq \frac{e^a + e^b}{2}.
\]

From above discussion, it is easy to conclude that we have good estimate of \( \int_a^b e^x dx \forall n \in \mathbb{N} \)

- Since \( f(x) = x^2e^{x^2} \) is non-decreasing convex function on \( (0, 1) \), so it is harmonic convex function. Therefore, by using inequality of Theorem 1 for \( a, b \in (0, \infty) \) and \( a \neq b \), we have

\[
\left( \frac{2ab}{a+b} \right)^2 e^{\left( \frac{2ab}{a+b} \right)^2} \leq \frac{ab}{b-a} \int_a^b e^{x^2} dx \leq \frac{a^2e^{a^2} + b^2e^{b^2}}{2}
\]

for all \( a, b \in (0, \infty) \).

- Since, \( f(x) = \sin (-x) \) is convex and non-decreasing function in \( (0, \frac{\pi}{2}) \), therefore it is harmonic convex \( \forall x \in (0, \frac{\pi}{2}) \). Therefore, by using inequality of Theorem 1 for \( a, b \in (0, \infty) \), we have

\[
\frac{\sin a + \sin b}{2} \leq \frac{ab}{b-a} \int_a^b \sin x dx \leq \sin \left( \frac{2ab}{a+b} \right)
\]

Similarly, we can estimate \( \int_a^b \frac{\sin x}{x} dx \) and \( \int_a^b \frac{\cos x}{x} dx \) for all \( n \in \mathbb{N} \) such that \( a, b \in (0, \infty) \).

5. Acknowledgement

The author wishes to express his heartfelt thanks to the referees for their constructive comments and helpful suggestions to improve the final version of this paper.

6. Conclusion

The harmonic convexity of a function is the basis for many inequalities in mathematics as you may see in this research paper. Furthermore, harmonic convexity provide analytic tool to estimate several known definite integral like $\int_{a}^{b} e^{x^2} dx$, $\int_{a}^{b} e^{x^5} dx$, $\int_{a}^{b} \sin(x^2) dx$ and $\int_{a}^{b} \cos(x^2) dx$, $\forall n \in \mathbb{N}$, where $a, b \in (0, \infty)$. We have discussed several important aspect of harmonic $p$-convex functions and encourage interested researcher to explore more interesting results for this class.
