

SOME INEQUALITIES IN 2-INNER PRODUCT SPACES

Y.J. CHO, S.S. DRAGOMIR, A. WHITE, AND S.S. KIM

ABSTRACT. In this paper we extend some results on the refinement of Cauchy-Buniakowski-Schwarz's inequality and Aćzel's inequality in inner product spaces to 2-inner product spaces.

1. INTRODUCTION

Let X be a real linear space of dimension greater than 1 and let $\|\cdot, \cdot\|$ be a real-valued function on $X \times X$ satisfying the following conditions:

- (N_1) $\|x, y\| = 0$ if and only if x and y are linearly dependent;
- (N_2) $\|x, y\| = \|y, x\|$;
- (N_3) $\|\alpha x, y\| = |\alpha| \|x, y\|$ for any real number α ;
- (N_4) $\|x, y + z\| \leq \|x, y\| + \|x, z\|$.

$\|\cdot, \cdot\|$ is called a *2-norm* on X and $(X, \|\cdot, \cdot\|)$ a *linear 2-normed space* cf. [10]. Some of the basic properties of the 2-norms are that they are nonnegative, and $\|x, y + \alpha x\| = \|x, y\|$ for every x, y in X and every real number α .

For any non-zero x_1, x_2, \dots, x_n in X , let $V(x_1, x_2, \dots, x_n)$ denote the subspace of X generated by x_1, x_2, \dots, x_n . Whenever the notation $V(x_1, x_2, \dots, x_n)$ is used, we will understand that x_1, x_2, \dots, x_n are linearly independent.

A concept which is closely related to linear 2-normed space is that of 2 inner product spaces. For a linear space X of dimension greater than 1 let $(\cdot, \cdot | \cdot)$ be a real-valued function on $X \times X \times X$ which satisfies the following conditions:

- (I_1) $(x, x | z) \geq 0$; $(x, x | z) = 0$ if and only if x and z are linearly dependent;
- (I_2) $(x, x | z) = (z, z | x)$;
- (I_3) $(x, y | z) = (y, x | z)$;
- (I_4) $(\alpha x, y | z) = \alpha (x, y | z)$ for any real number α ;
- (I_5) $(x + x', y | z) = (x, y | z) + (x', y | z)$.

$(\cdot, \cdot | \cdot)$ is called a *2-inner product* and $(X, (\cdot, \cdot | \cdot))$ a *2-inner product space* ([3]).

These spaces are studied extensively in [1], [2], [4]-[6] and [11]. In [3] it is shown that $\|x, z\| = (x, x | z)^{\frac{1}{2}}$ is a 2-norm on $(X, \|\cdot, \cdot\|)$. Every 2-inner product space will be considered to be a linear 2-normed space with the 2-norm

1991 *Mathematics Subject Classification*. Primary 26D99; Secondary 46Cxx.

Key words and phrases. 2-Inner Product, Cauchy-Buniakowski-Schwarz's Inequality, Triangle Inequality, Aćzel's Inequality.

This paper has been supported in part by NON-DIRECTED RESEARCH FUND, Korea Research Foundation, 1996.

$\|x, z\| = (x, x | z)^{\frac{1}{2}}$. R. Ehret, [9], has shown that for any 2-inner product space $(X, (\cdot, \cdot | \cdot))$, $\|x, z\| = (x, x | z)^{\frac{1}{2}}$ defines a 2-norm for which

$$(1.1) \quad (x, y | z) = \frac{1}{4} \left(\|x + y, z\|^2 - \|x - y, z\|^2 \right),$$

$$(1.2) \quad \|x + y, z\|^2 + \|x - y, z\|^2 = 2 \left(\|x, z\|^2 + \|y, z\|^2 \right).$$

Besides, if $(X, \|\cdot, \cdot\|)$ is a linear 2-normed space in which condition (1.2), being a 2-dimensional analogue of the parallelogram law, is satisfied for every $x, y, z \in X$, then a 2-inner product on X is defined on by (1.1).

For a 2-inner product space $(X, (\cdot, \cdot | \cdot))$ Cauchy-Schwarz's inequality

$$|(x, y | z)| \leq (x, x | z)^{\frac{1}{2}} (y, y | z)^{\frac{1}{2}} = \|x, z\| \|y, z\|,$$

a 2-dimensional analogue of Cauchy-Buniakowski-Schwarz's inequality, holds (cf. [3]).

2. REFINEMENTS OF CAUCHY-SCHWARZ'S INEQUALITY

Throughout this paper, let $(X, (\cdot, \cdot | \cdot))$ denote a 2-inner product space with $\|x, z\| = (x, x | z)^{\frac{1}{2}}$, \mathbf{R} the set of real numbers and \mathbf{N} the set of natural numbers.

Theorem 2.1. *Let $x, y, z, u, v \in X$ with $z \notin V(x, y, u, v)$ be such that*

$$(2.1) \quad \|u, z\|^2 \leq 2(x, u | z), \quad \|v, z\|^2 \leq 2(y, v | z).$$

Then, we have the inequality

$$(2.2) \quad \left(2(x, u | z) - \|u, z\|^2 \right)^{\frac{1}{2}} \left(2(y, v | z) - \|v, z\|^2 \right)^{\frac{1}{2}} \\ + |(x, y | z) - (x, v | z) - (u, y | z) + (u, v | z)| \leq \|x, z\| \|y, z\|.$$

Proof. Note that

$$(2.3) \quad (m^2 - n^2)(p^2 - q^2) \leq (mp - nq)^2$$

for every $m, n, p, q \in \mathbf{R}$. Since

$$\begin{aligned} & |(x, y | z) - (x, v | z) - (u, y | z) + (u, v | z)|^2 \\ &= |(x - u, y - v | z)|^2 \leq \|x - u, z\|^2 \|y - v, z\|^2 \\ &= \left(\|x, z\|^2 + \|u, z\|^2 - 2(x, u | z) \right) \left(\|y, z\|^2 + \|v, z\|^2 - 2(y, v | z) \right), \end{aligned}$$

by (2.3), we have

$$(2.4) \quad |(x, y | z) - (x, v | z) - (u, y | z) + (u, v | z)|^2 \\ \leq \left\{ \|x, z\| \|y, z\| - \left(2(x, u | z) - \|u, z\|^2 \right)^{\frac{1}{2}} \left(2(y, v | z) - \|v, z\|^2 \right)^{\frac{1}{2}} \right\}^2.$$

On the other hand

$$0 \leq \left(2(x, u | z) - \|u, z\|^2 \right)^{\frac{1}{2}} \leq \|x, z\|, \\ 0 \leq \left(2(y, v | z) - \|v, z\|^2 \right)^{\frac{1}{2}} \leq \|y, z\|,$$

which imply

$$\left(2(x, u | z) - \|u, z\|^2\right)^{\frac{1}{2}} \left(2(y, v | z) - \|v, z\|^2\right)^{\frac{1}{2}} \leq \|x, z\| \|y, z\|.$$

Therefore, from (2.4), we have the inequality (2.2). This completes the proof. ■

Corollary 2.2. *Let $x, y, z, e \in X$ be such that $\|e, z\| = 1$ and $z \notin V(x, y, e)$. Then*

$$(2.5) \quad |(x, y | z)| \leq |(x, y | z) - (x, e | z)(e, y | z)| \\ + |(x, e | z)(e, u | z)| \leq \|x, z\| \|y, z\|.$$

Proof. If we put $u = (x, e | z)e$ and $v = (y, e | z)e$, then the conditions (2.1) hold. In fact,

$$2(x, u | z) - \|u, z\|^2 = 2(x, (x, e | z)e | z) - \|(x, e | z)e, z\|^2 \\ = 2(x, e | z)(x, e | z) - (x, e | z)^2 = (x, e | z)(x, e | z) \geq 0.$$

And similarly for the second condition in (2.1).

Moreover,

$$|(x, y | z) - (x, v | z) - (u, y | z) + (u, v | z)| \\ = |(x, y | z) - (x, e | z)(y, e | z) - (x, e | z)(e, y | z) + (x, e | z)(y, e | z)| \\ = |(x, y | z) - (x, e | z)(e, y | z)|$$

so, by Theorem 2.1, we have (2.5). ■

Corollary 2.3. *Let $x, y, z \in X$ be such that $\|x, z\|^2 \leq 2$, $\|y, z\|^2 \leq 2$ and $z \notin V(x, y)$. Then*

$$(2.6) \quad |(x, y | z)|^2 \left(2 - \|x, z\|^2\right)^{\frac{1}{2}} \left(2 - \|y, z\|^2\right)^{\frac{1}{2}} \\ + |(x, y | z)| \left|1 - \|x, z\|^2 - \|y, z\|^2 + (x, y | z)\right|^2 \leq \|x, z\| \|y, z\|.$$

Proof. If we put $u = (x, y | z)y$ and $v = (y, x | z)x$, then the inequality (2.3) holds. Moreover, we have

$$\left(2(x, u | z) - \|u, z\|^2\right)^{\frac{1}{2}} \left(2(y, v | z) - \|v, z\|^2\right)^{\frac{1}{2}} \\ = |(x, y | z)|^2 \left(2 - \|x, z\|^2\right)^{\frac{1}{2}} \left(2 - \|y, z\|^2\right)^{\frac{1}{2}}, \\ |(x, y | z) - (x, v | z) - (u, y | z) + (u, v | z)| \\ = |(x, y | z)| \left|1 - \|x, z\|^2 - \|y, z\|^2 + |(x, y | z)|^2\right|.$$

Therefore, by Theorem 2.1, we have the inequality (2.6). ■

Theorem 2.4. *Let $x, y, z, e \in X$ be such that $\|e, z\| = 1$ and $z \notin V(x, y, e)$. Then*

$$(2.7) \quad |(x, y | z) - (x, e | z)(e, y | z)|^2 \\ \leq \left(\|x, z\|^2 - |(x, e | z)|^2\right) \left(\|y, z\|^2 - |(y, e | z)|^2\right).$$

Proof. Consider a mapping $P : X \times X \times X \rightarrow \mathbf{R}$ defined by $P(x, y, z) = (x, y | z) - (x, e | z)(e, y | z)$ for every $x, y, z, e \in X$, having the properties:

- (i) $P(x, x, z) \geq 0$,
- (ii) $P(\alpha x + \beta x', y, z) = P(x, y, z) + \beta P(x', y, z)$,
- (iii) $P(x, y, z) = P(y, x, z)$.

Then Cauchy-Schwarz's inequality

$$(2.8) \quad |P(x, y, z)|^2 \leq P(x, x, z) P(y, y, z)$$

holds.

Indeed, we observe that

$$\begin{aligned} 0 &\leq P(x + \alpha P(x, y, z)y, x + \alpha P(x, y, z)y, z) \\ &= P(x, x, z) + 2\alpha P(x, y, z)^2 + \alpha^2 P(x, y, z)^2 P(y, y, z) \quad (\forall \alpha \in \mathbf{R}). \end{aligned}$$

It is well known that if $a \geq 0$ and

$$a\alpha^2 + \beta\alpha + c \geq 0 \quad \text{for all } \alpha \in \mathbf{R},$$

then $\Delta = b^2 - 4ac \leq 0$.

Then by the above inequality we deduce

$$(2.9) \quad P(x, y, z)^4 \leq P(x, x, z) P(y, y, z) P(x, y, z)^2.$$

If $P(x, y, z) = 0$ then (2.8) holds.

If $P(x, y, z) \neq 0$ then we can divide in (2.9) by $P(x, y, z)$ and obtain (2.8).

The theorem is thus proved. ■

Remark 2.1. By the inequalities (2.3) and (2.7), we have

$$\begin{aligned} &|(x, y | z) - (x, e | z)(e, y | z)|^2 \\ &\leq \left(\|x, z\|^2 - |(x, e | z)|^2 \right) \left(\|y, z\|^2 - |(y, e | z)|^2 \right) \\ &\leq (\|x, z\| \|y, z\| - |(x, e | z)(e, y | z)|)^2. \end{aligned}$$

Since $\|x, z\| \|y, z\| \geq |(x, e | z)(e, y | z)|$, we get

$$|(x, y | z) - (x, e | z)(e, y | z)| \leq \|x, z\| \|y, z\| - |(x, e | z)(e, y | z)|,$$

which yields the inequality (2.5).

Corollary 2.5. Let $x, y, z, e \in X$ be such that $\|e, z\| = 1$ and $z \notin V(x, y, e)$. Then

$$(2.10) \quad \begin{aligned} &\left(\|x + y, z\|^2 - |(x + y, e | z)|^2 \right)^{\frac{1}{2}} \\ &\leq \left(\|x, z\|^2 - |(x, e | z)|^2 \right)^{\frac{1}{2}} + \left(\|y, z\|^2 - |(y, e | z)|^2 \right)^{\frac{1}{2}}. \end{aligned}$$

Proof. If we define $S : X \times X \rightarrow \mathbf{R}$ by $S(x, z) = P(x, x, z)^{\frac{1}{2}}$ for every $x, y \in X$ and use the triangle inequality for $S(x, z)$, then we have (2.10). ■

Corollary 2.6. For every non-zero $x, y, z, u \in X$, with $z \notin V(x, y, u)$, we have

$$(2.11) \quad \begin{aligned} &\left| \frac{(x, y | z)}{\|x, z\| \|y, z\|} \right|^2 + \left| \frac{(y, u | z)}{\|y, z\| \|u, z\|} \right|^2 + \left| \frac{(u, x | z)}{\|u, z\| \|x, z\|} \right|^2 \\ &\leq 1 + 2 \left| \frac{(x, y | z)(y, u | z)(u, x | z)}{\|x, z\|^2 \|y, z\|^2 \|u, z\|^2} \right|. \end{aligned}$$

For the proof of next theorem, we need the following lemma:

Lemma 2.7. *For every non-zero $x, y, z \in X$ with $z \notin V(x, y)$, we have*

$$(2.12) \quad (\|x, z\| + \|y, z\|) \left\| \frac{x}{\|x, z\|} - \frac{y}{\|y, z\|}, z \right\| \leq 2 \|x - y, z\|.$$

Proof. Since

$$\frac{\|x, z\|}{\|y, z\|} + \frac{\|y, z\|}{\|x, z\|} \geq 2,$$

we have the inequality

$$\begin{aligned} & (\|x, z\| + \|y, z\|)^2 - (x, y | z) \left(\frac{\|x, z\|}{\|y, z\|} + \frac{\|y, z\|}{\|x, z\|} \right) - 2(x, y | z) \\ & \leq 2 \|x, z\|^2 + \|y, z\|^2 - 4(x, y | z) \end{aligned}$$

which implies (2.12). ■

Theorem 2.8. *For every non-zero $x, y, z \in X$ with $z \notin V(x, y)$ we have*

$$(2.13) \quad \begin{aligned} & (\|x, z\| + \|y, z\|)^2 \left(\left\| \frac{x}{\|x, z\|} - \frac{y}{\|y, z\|}, z \right\|^2 + \left\| \frac{x}{\|x, z\|} + \frac{y}{\|y, z\|}, z \right\|^2 \right) \\ & \leq 8 (\|x, z\|^2 + \|y, z\|^2). \end{aligned}$$

Proof. By (2.12) we have

$$\begin{aligned} & (\|x, z\| + \|y, z\|)^2 \left(\left\| \frac{x}{\|x, z\|} - \frac{y}{\|y, z\|}, z \right\|^2 + \left\| \frac{x}{\|x, z\|} + \frac{y}{\|y, z\|}, z \right\|^2 \right) \\ & \leq 4 (\|x - y, z\|^2 + \|x + y, z\|^2) \end{aligned}$$

and, by a 2-dimensional analogue of the parallelogram law, we get (2.13). ■

Remark 2.2. *For some similar results in inner product spaces, see [7].*

3. ÁCZEL'S INEQUALITY

In this section, we shall point out some results in 2-inner product spaces in connection to Áczel's inequality [12]. For some other similar results in inner products, see [8]. We note that the results obtained here, in 2-inner product spaces used different techniques as those in [8].

Theorem 3.1. *Let $(X, (\cdot, \cdot | \cdot))$ be a 2-inner product space, $M_1, M_2 \in \mathbf{R}$ and $x, y, z \in X$ such that*

$$\|x, z\| \leq |M_1|, \quad \|y, z\| \leq |M_2|,$$

then

$$(3.1) \quad \left(M_1^2 - \|x, z\|^2 \right) \left(M_2^2 - \|y, z\|^2 \right) \leq (|M_1 M_2| - (x, y | z))^2.$$

Proof. Using the elementary inequality (2.3), we get

$$0 \leq \left(M_1^2 - \|x, z\|^2 \right) \left(M_2^2 - \|y, z\|^2 \right) \leq (|M_1 M_2| - \|x, z\| \|y, z\|)^2,$$

and by Cauchy-Schwarz's inequality,

$$0 \leq |M_1 M_2| - \|x, z\| \|y, z\| \leq |M_1 M_2| - (x, y | z)$$

implying (3.1). ■

Corollary 3.2. *If $x, y, z \in X$, are such that $\|x, z\|, \|y, z\| \leq M, M > 0$, then we have the inequality*

$$(3.2) \quad 0 \leq \|x, z\|^2 \|y, z\|^2 - (x, y | z)^2 \leq M^2 \|x - y, z\|^2$$

which is a counterpart of Cauchy-Schwarz's inequality.

Another similar results to the generalization (3.1) of Aczel's inequality is the following one

Theorem 3.3. *Let $(X, (\cdot, \cdot | \cdot))$ be a 2-inner product space, and $M_1, M_2 \in \mathbf{R}$ and $x, y, z \in X$ such that $\|x, z\| \leq |M_1|, \|y, z\| \leq |M_2|$. Then*

$$(3.3) \quad (|M_1| - \|x, z\|)^{\frac{1}{2}} (|M_2| - \|y, z\|)^{\frac{1}{2}} \leq |M_1 M_2|^{\frac{1}{2}} - |(x, y | z)|^{\frac{1}{2}}.$$

Proof. Applying (2.3) for $m = \sqrt{|M_1|}, p = \sqrt{|M_2|}, n = \sqrt{\|x, z\|}, q = \sqrt{\|y, z\|}$ and using Cauchy-Schwarz's inequality for 2-inner products we deduce (3.3). ■

Corollary 3.4. *Suppose that $x, y, z \in X$ and $M > 0$ are such that $\|x, z\|, \|y, z\| \leq M$. Then we have the following converse of Cauchy-Schwarz's inequality*

$$(3.4) \quad 0 \leq \|x, z\| \|y, z\| - |(x, y | z)| \\ \leq M \left(\|x, z\| + \|y, z\| - 2 |(x, y | z)|^{1/2} \right).$$

Theorem 3.5. *Let $(\cdot, \cdot | \cdot)$ be a 2-inner product and $\{(\cdot, \cdot | \cdot)_i\}_{i \in \mathbf{N}}$ a sequence of 2-inner products satisfying*

$$(3.5) \quad \|x, z\|^2 > \sum_{i=0}^{\infty} \|x, z\|_i^2$$

for all x, z , being linearly independent. Then we have the following refinement of Cauchy-Schwarz's inequality

$$(3.6) \quad \|x, z\| \|y, z\| - |(x, y | z)|$$

$$(3.7) \quad \geq \left[\sum_{i=0}^{\infty} \|x, z\|_i \sum_{i=0}^{\infty} \|y, z\|_i - |(x, y | z)| \right] \geq 0$$

for all $x, y, z \in X$.

Proof. Let $n \in \mathbf{N}$ and $n \geq 1$. Define the mapping

$$(x, y | z)_n = (x, y | z) - \sum_{i=0}^n (x, y | z)_i, \quad x, y, z \in X.$$

We observe, by (3.5), that the mapping $(\cdot, \cdot | \cdot)_n$ satisfies the properties

- (i) $(x, x | z)_n \geq 0$,
- (ii) $(\alpha x + \beta x', y | z)_n = \alpha (x, y | z)_n + \beta (x', y | z)_n$,

- (iii) $(x, y | z)_n = (y, x | z)_n$
for every $x, x', y, z \in X$ and $\alpha, \alpha' \in \mathbf{R}$.

By a similar proof to that in Theorem 2.4, we can state Cauchy-Schwarz's inequality

$$(x, x | z)_n (y, y | z)_n \geq |(x, y | z)_n|^2, \quad x, y, z \in X,$$

that is

$$(3.8) \quad \left(\|x, z\|^2 - \sum_{i=0}^n \|x, z\|_i^2 \right) \left(\|y, z\|^2 - \sum_{i=0}^n \|y, z\|_i^2 \right) \\ \geq \left((x, y | z) - \sum_{i=0}^n (x, y | z)_i \right)^2.$$

Using Áczel's inequality [12]

$$\left(a^2 - \sum_{i=0}^m a_i^2 \right) \left(b^2 - \sum_{i=0}^m b_i^2 \right) \leq \left(ab - \sum_{i=0}^m a_i b_i \right)^2,$$

where $a, b, a_i, b_i \in \mathbf{R}$ for $i = 0, \dots, m$; we can prove that

$$(3.9) \quad \left(\|x, z\| \|y, z\| - \sum_{i=0}^n \|x, z\|_i \|y, z\|_i \right)^2 \\ \geq \left(\|x, z\|^2 - \sum_{i=0}^n \|x, z\|_i^2 \right) \left(\|y, z\|^2 - \sum_{i=0}^n \|y, z\|_i^2 \right)$$

for all $x, y, z \in X$. Since, by Cauchy-Buniakowski-Schwarz's inequality

$$\|x, z\| \|y, z\| \geq \left(\sum_{i=0}^n \|x, z\|_i^2 \sum_{i=0}^n \|y, z\|_i^2 \right)^{1/2} \geq \sum_{i=0}^n \|x, z\|_i \|y, z\|_i,$$

then by (3.8) and (3.9) we deduce

$$\|x, z\| \|y, z\| - \sum_{i=0}^n \|x, z\|_i \|y, z\|_i \\ = \left| \|x, z\| \|y, z\| - \sum_{i=0}^n \|x, z\|_i \|y, z\|_i \right| \geq |(x, y | z)| - \sum_{i=0}^n |(x, y | z)_i|$$

which implies (3.6), by using the inequality

$$\|x, z\|_i \|y, z\|_i - |(x, y | z)_i| \geq 0.$$

The theorem is thus proved. ■

The following corollaries are interesting as refinements of the triangle inequality for 2-norms generated by 2-inner products.

Corollary 3.6. *With the assumptions from Theorem, we have the following refinement of the triangle inequality*

$$(\|x, z\| + \|y, z\|)^2 - \|x + y, z\|^2$$

$$\geq \sum_{i=0}^{\infty} \left[(\|x, z\|_i + \|y, z\|_i)^2 - \|x + y, z\|_i^2 \right] \geq 0, x, y, z \in X.$$

Corollary 3.7. Let $(\cdot, \cdot | \cdot)_1, (\cdot, \cdot | \cdot)_2$ be two 2-inner products such that

$$\|x, z\|_2 > \|x, z\|_1$$

for all x, z being linearly independent in X . Then

$$\begin{aligned} & \|x, z\|_2 \|y, z\|_2 - |(x, y | z)_2| \\ & \geq \|x, z\|_1 \|y, z\|_1 - |(x, y | z)_1| \geq 0, x, y, z \in X. \end{aligned}$$

Corollary 3.8. Let $(\cdot, \cdot | \cdot)_1, (\cdot, \cdot | \cdot)_2$ be as above. Then

$$\begin{aligned} & (\|x, z\|_2 + \|y, z\|_2)^2 - \|x + y, z\|_2^2 \\ & \geq (\|x, z\|_1 + \|y, z\|_1)^2 - \|x + y, z\|_1^2 \geq 0, x, y, z \in X. \end{aligned}$$
